

**(A) - ALLWAYS ON LINE SYSTEM ALTERNATIVES  
CORPORATE COMPANIES WITH A 24 HOUR SERVICE  
WITH GEOBIS NET AVL**

This alternative is the one that permits your company to track online, all the time, any number of mobile assets, vehicles, trucks, containers, busses, boats or planes, etc through Geobis International web servers 24 hours a day, 7 days a week, 52 weeks per year.

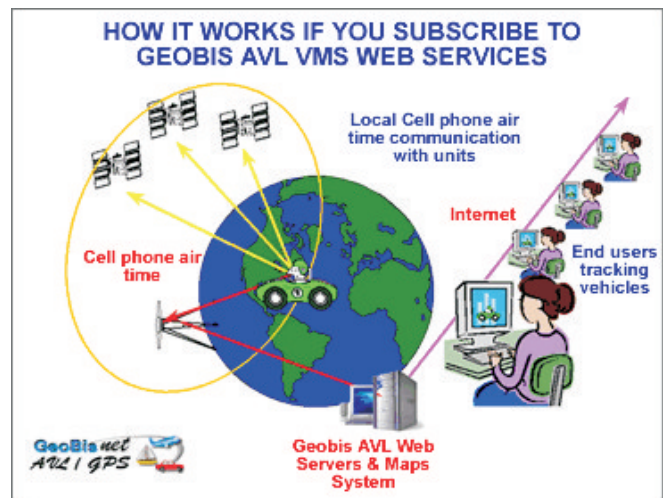

▣ Requirements for this alternative :

This alternative starts functioning with only a single AVL/GPS unit, this unit transmits its location values and clients additional configurable data requirements, to Geobis International web servers.

▣ How it works :

Normally a single AVL/GPS unit receives satellite information, this information is processed to find the real geographic position. This information is stored into the AVL/GPS memory. With some periodicity, this information is delivered to a central command office of Geobis International. How is this information delivered?. Each AVL/GPS unit includes a Cellular phone or a Satellite Transmitter to transmit the position of mobile assets, vehicles, trucks, containers, busses, boats, or planes, etc. This information is then displayed on maps, at the user's monitor.

Special agreements to link Geobis servers to any web site are allowed under prior talks.

Note : Geobis International does not bring any airtime for local communication by Cellular Phone and or by Satellite. Owners of the AVL/GPS units need to buy the airtime for one or both alternatives of communication.
